Nutrition and growth: comparing the effects of energy and protein restriction in preterm infants.

Research on the effect of nutrition on the development of infants born preterm has focussed on energy versus protein restriction. The objective of this review was to evaluate the evidence on the effects of energy and protein restriction. We identified 8 relevant studies, 4 of which were randomized controlled trials. The main outcome measures were: anthropometric, laboratory, immunological, neurodevelopmental outcomes, intestinal function, and metabolic indices. The most consistent and significant effects were weight gain and intestinal weight, which increased with energy restriction. There were no significant differences in weight or height between energy and protein restriction, and only small differences in plasma amino acid concentrations were found. The studies published to date suggest that energy restriction is the most effective means of nutritional intervention for preterm infants, although it does not lead to significantly greater growth than protein restriction. #ifndef CR_RESPONSE_H #define CR_RESPONSE_H #include #include "common/serialization_utils.h" struct Ccj; struct CcrResponse { std::uint64_t frame_num; CcrResponse() {
